San Antonio, Texas 78233

INTRODUCTION

Mr. Gene William, General Manager of the Headwaters Groundwater Conservation District, asked LBG-Guyton Associates to perform a pumping test and retrieve a water sample from a newly constructed Monitor Well 15 located in the central portion of Kerr County approximately 6 miles south-southwest of Hunt, Texas (Figure 1). The well was constructed in March 2016 by Aqua Tech Drilling Inc. of Pipe Creek, Texas. The Driller's Report is included in Appendix 1.

The latitude and longitude for the monitor well are listed in the following table, along with surface elevations:

Well	**Latitude**	**Longitude**	**Approximate Surface Elevation** (feet above MSL)	**Water-Level Depth** (feet below land surface)
Monitor Well 15	30º 00' 34.05"	99º 22' 49.63"	1867	335.5

The approximate surface elevations, latitude and longitude were taken from Google Earth.

PUMPING TEST ANALYSES

General Information on Pumping Tests

When a well is pumped and water is withdrawn from an aquifer, water levels in the vicinity are drawn down to form an inverted cone with its apex located at the pumping well. This is referred to as a cone of depression. Groundwater flows from higher water levels to lower water levels and, therefore, in the case of a pumping well, toward the well or the center of the cone of depression. The shape and size of the cone is directly related to the aquifer parameters.

Various hydrologic parameters are required to make a quantitative evaluation of an aquifer. The primary aquifer characteristics of concern are transmissivity (T), which is an index of the aquifer's ability to transmit water measured in gallons per day per foot (gpd/ft), and its storage coefficient (unitless), which is an index of the amount of water released from or taken

into storage as water levels change. Hydraulic conductivity can be calculated by dividing the calculated T by the aquifer thickness; the unit of measurement is gallons per day per foot squared (gpd/ft^2). Important measurements made during a pumping test are well discharge and water-level decline versus time.

One of the basic assumptions in determining these parameters from pumping-test data is that flow takes place through a homogeneous medium having the same properties in all directions. In properly applying the results, however, one must be mindful of their limitations and take into consideration the physical characteristics of the aquifer, which are usually not the same in all directions.

Monitor Well 15 Pumping Test

Aquatech Drilling installed a 30-horsepower, Grundfos submersible pump at a depth of about 600 feet in Monitor Well 15 with the bottom of the pump at the top of the lap section in the well. A trailer-mounted generator was used to supply energy to the pump. A totalizing water meter was installed in the discharge line to observe flow rate and total number of gallons discharged during testing.

LBG-Guyton Associates installed an In-Situ Level Troll transducer in the well just above the pump prior to testing. The transducer is rated for 100 pounds per square inch (psi) (2.31 feet/psi x 100 psi = 231 feet) and records water pressure, which is converted to feet of water above the probe. These data are then converted to depth of water from land surface by comparing the transducer readings to measurements made with a calibrated electrical tape. The transducer recorded water levels during pumping and recovery of the well. Data from the pumping test were analyzed using the Cooper-Jacob method. This method is described in detail in a number of hydrology textbooks, including Freeze and Cherry (1979) and Driscoll (1986).

Hydrographs of the water levels measured in Monitor Well 15 are shown in Figures 2. The results are graphed on a semi-log scale and calculations are shown in Figures 3. The following table lists the pumping rate and summarizes the results calculated from the pumping tests:

Date Pumping Test Started	**Average Pumping Rate** (gpm)	**Draw-down** (feet)	**Specific Capacity** (gpm/ft)	**Transmissivity** (gpd/ft)
3/30/16	164	79.4	2.1	2,730

WATER QUALITY ANALYSES

All groundwater contains minerals that are dissolved and transported in solution. The types and concentrations of the minerals depend upon the history of the water, its source, movement and environment. Specifically, the dissolved solids depend upon the solubility of the minerals present in the rocks through which the water moves, the length of time the water is in contact with the rocks and the chemical activity of the water. In general, the concentration of dissolved minerals in groundwater increases with depth. This is especially true where circulation in the deeper sediments is restricted by low permeability. Restricted circulation retards the flushing action of water moving through the aquifer and causes the water to become more stagnant and highly mineralized. The Trinity Aquifer in Central Texas generally yield water that ranges from fresh, which is less than 1,000 milligrams per liter (mg/l) total dissolved solids (TDS), to slightly saline (1,000 to 3,000 mg/l TDS).

LBG-Guyton Associates collected a water sample from the well approximately 4 hours after the pumping test started. The following table lists the field parameters measured near the time of sampling.

Date	**Temperature** (ºC)	**Specific Conductivity** (µmhos)	**pH**
3/30/16	25.2	970	7.7

Even though this is a monitor well with the water not intended for public consumption, the Primary and Secondary Safe Drinking Water Standards mandated by the U. S. Environmental Protection Agency and the Texas Commission on Environmental Quality are listed below for comparison. Primary Standards are concerned with dissolved constituents that are known to

have adverse effects on human health. Secondary Standards are concerned with aesthetic qualities of drinking water (e.g., taste and odor).

The samples were analyzed for metals (calcium, iron, magnesium, potassium and sodium), minor metals (aluminum, arsenic, copper, manganese, and zinc), anions (chloride, fluoride, nitrate and nitrite as N, sulfate and bicarbonate alkalinity as $CaCO_3$), total dissolved solids and radionuclide. The Pollution Control Services in San Antonio, Texas performed the analyses. The laboratory reports for these analyses are provided in Appendix 2. The results are summarized in the following tables listed with standards for public drinking water for comparison:

Primary Standards		**Well 15 (mg/l)**
Constituent		
Fluoride (mg/l)	4	**1.19**
Nitrate (mg/l as N)	10	**<0.2**
Nitrite (mg/l as N)	1	**<0.20**
Arsenic (mg/l)	0.05	**<0.0005**
Secondary Standards		
Constituent		
Aluminum (mg/l)	0.2	**0.134**
Chloride (mg/l)	300	**58**
Copper (mg/l)	1	**<0.005**
Fluoride (mg/l)	2	**1.19**
Iron (mg/l)	0.3	**0.378**
Manganese (mg/l)	0.05	**<0.010**
Sulfate (mg/l)	300	**58**
Zinc (mg/l)	5.0	**0.085**
Dissolved Solids (mg/l)	1,000	**468**

Radionuclide Primary Standards		
Constituents		
Gross alpha (pCi/l)	15	11.9 +/- 3.36
Radium-226/228 (pCi/l)	5	2.67+/- 0.964
Beta particle (pCi/l)	50	10.0 +/- 2.21
Uranium (µg/l)	30	3.87 +/- 0.071

** Samples submitted for Metals Analysis (except Hex Cr) or Drinking Water for Coliform Bacteria Only are not required to be iced. Samples collected prior day to receipt at the laboratory must meet method specific thermal cooling requirements, "or will be flagged accordingly". Samples delivered the same day as collected may not meet thermal criteria, but shall be considered acceptable if evidence that the chilling process has begun, such as arrival on ice (EPA 815-F-08-006, June 2008). ** Water samples for metals analysis that are not acid preserved prior to shipment may be acceptably preserved by the laboratory on receipt – however, the sample digestion procedure must be delayed for at least 24 hours after preservation by the laboratory.*

RE: Project: 428371
Pace Project No.: 7542110

Dear Chuck Wallgren:
Enclosed are the analytical results for sample(s) received by the laboratory on April 05, 2016. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Ayisha Raza

QUALIFIERS

Project: 428371
Pace Project No.: 7542110

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval). Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

** Samples submitted for Metals Analysis (except Hex Cr) or Drinking Water for Coliform Bacteria Only are not required to be iced. Samples collected prior day to receipt at the laboratory must meet method specific thermal cooling requirements, "or will be flagged accordingly". Samples delivered the same day as collected may not meet thermal criteria, but shall be considered acceptable if evidence that the chilling process has begun, such as arrival on ice (EPA 815-F-08-006, June 2008). ** Water samples for metals analysis that are not acid preserved prior to shipment may be acceptably preserved by the laboratory on receipt – however, the sample digestion procedure must be delayed for at least 24 hours after preservation by the laboratory.*
